Multiblitz octoboxes are equipped with a removable internal- and a front diffuser they're suitable for all applications where soft and broad light sources are needed, such as: Fashion, advertising and weddings. They're also great for portraiture work where a circular catch-light in the eyes is desired. With no diffuser attached at all, the illumination is focused in the center of the box, producing a hard light with strong shadows and high contrast. With the internal diffuser attached only, the light character becomes more soft and evenly spreaded. Shadows are already not as harsh. With the front diffuser attached only, the illumination tends to be even more soft and has a slightly warmer character. Shadows are softer as with the inner diffuser. There is a still noticeable high contrast due to the reason that the internal diffuser is not attached. With both diffusers attached, the light character will be beautifully balanced, very soft and warm. Shadows are slightly darker and more defined than with the internal- or front diffuser attached only.
